

Lung cancer spread to the through the peritoneum cavity

My mother was diagnosed with Stage 4 EGFR Exon 19 positive Lung cancer 3 years ago and has been on Tarceva during this time with very good results. Her most recent CT scans showed a small tumor in the liver (8mm) and around the same time she recently became unwell (unable to eat or drink) and so we had a Pet Scan which showed fairly widespread cancer spread to the intestines causing a blockage. We are working on switching to Afatinib but are also considering if radiation can shrink these tumors to where her intestine can allow food and water to pass through. Does anybody know if radiation can help this condition.? Surgeons have said surgery is very risky
