

9mm lung nodule and lytic rib lesion

Cheryl3700

Hi, I found this site highly helpful back in 2011 when my mom had lung cancer. Now finding myself back here, husband having issues. First symptom, swelling in RUQ. Little pain. Dr thought hernia, ultra sound negative. Onto CT scan found lytic lesion of 7th rib on right side, plus 9mm nodule in lower left lung. He also had 2 confirmed SCC skin cancer last year on scalp, grenz radiation 8 cycles.

I know SCC skin can metastasize, but rare. Indications of the SCC report were not concerning for spread.

Question is, can a 9mm lung nodule metasasize to bone? Just not sure if it's too small to do that?

Thank you for this wonderful site!!
