Treatment for pleomorphic carcinoma

My dad (66 years) was recently diagnosed with stage 4 pleomorphic carcinoma. The pathology report for the biopsy shows positive for TTF-1, Napsin A, CK7 and negative for CK20 and weakly positive for CK5/6. It is also negative for EGFR and ALK. So my oncologist recommended chemo with Alimta (Pemetrexed) and Carboplatin (Paraplatin). I did some reading and learned that this is a rare and aggressive cancer that is less researched and difficult to treat.

1) Is this test conclusive? Should I get a 2nd opinion?
2) What other treatment options are there for pleomorphic carcinoma?
3) Anyone know of any expert for this type of lung cancer?

Thank you in advance.
